Hospivo: App and UI Description

What the Hospivo app is, what it does on every page, and how its screens look and feel for 40 to 50 year old shop owners and staff.

1. What Hospivo is

Hospivo is a software for an Indian medical store (dawai ki dukaan). It runs in the browser on the shop's computer or phone, like an app, and **keeps working without internet** after it is first opened. All shop data stays on the shop's own device.

It does the daily work of the shop in one place:

- Selling medicines and making bills (normal billing and a very fast mode for rush hours)
- Keeping stock of every medicine, batch by batch, with expiry dates
- Warning about medicines that will expire soon
- Recording purchases from suppliers with a photo of the invoice
- Keeping the udhaar (credit) of regular customers and reminding them on WhatsApp
- Printing barcode stickers for medicines and shelves
- Showing where each medicine is kept (shelf number and photo)
- Closing the day with a cash check and a report the owner can read on WhatsApp
- Showing the owner sales, profit, expiry loss and staff activity

The app is made for people who know only WhatsApp and Facebook. Everything is in big buttons, simple Hindi words written in English letters, and one clear job per screen.

2. Who uses it

Person	What they do	What they can see
Owner	Watches the business, checks stock and expiry, approves special actions	Everything, including profit and purchase prices
Counter staff (cashier)	Makes bills, takes payment, adds stock, closes the day	Selling screens only. No profit, no purchase price, cannot edit MRP or delete a bill

Person	What they do	What they can see
Runner (medicine bringer)	Collects medicines from shelves and scans them	Does not use a screen, only the scanner

Special actions (deleting a bill, changing a price, a large discount, fixing stock) need the **Owner PIN**, a 4 to 6 digit number that only the owner knows.

3. How a normal day goes

1. **Morning:** staff opens the app, logs in with name and PIN, sees Home. The app shows today's alerts (expiring medicines, low stock, udhaar to collect).
2. **During the day:** staff sells medicines with Dawai Becho. When a delivery arrives, staff adds it with Stock Jodo. In rush hours, the runner scans medicines and the cashier finishes bills one after another.
3. **Evening:** staff presses Din Band, counts cash, takes a counter photo and sends the day report to the owner on WhatsApp.
4. **Anytime:** the owner opens the Owner area to see reports and checks. Once a day the app saves a backup copy of all data.

4. Page by page

4.1 First-time setup (only once)

Shown the very first time the app is opened. Steps, one per screen:

1. **Dukaan ki jaankari:** shop name, owner name, address, phone, GST number, drug licence numbers.
2. **Owner PIN banao:** the owner chooses a PIN and types it twice.
3. **Staff jodo:** add the first staff name and PIN (can be skipped and done later).
4. **Medicine list:** choose to import a medicine list from a file or start empty.
5. **Backup:** the app explains that it will save a backup file every day and asks permission to keep data safely on the device.

After step 5 the Home screen opens.

4.2 Login

- Shows the list of names (Owner, then staff names) as big buttons.
- Tap a name, then type the PIN on a large number pad.
- Wrong PIN: red message "PIN galat hai" and the pad clears. Right PIN: opens Home.
- If the app is not used for 5 minutes, it locks and shows the pad again.

4.3 Home

The starting point of everything. It shows a top bar and big buttons.

- **Top bar:** shop name, an "Offline OK" tick, last backup ("Backup: Aaj"), the logged-in person's name, and a light/dark switch.
- **Big buttons:**
  - **Dawai Becho** opens Billing (4.4)
  - **Fast Bill** opens Rush Mode (4.5)
  - **Stock Jodo** opens Purchase entry (4.7)
  - **Stock Dekho** opens Stock (4.8)
  - **Expiry** opens Expiry alerts (4.9)
  - **Udhaar** opens Customers and credit (4.10)
  - **Din Band** opens Daily closing (4.14)
  - **Owner** opens the Owner area (4.15), asks for the Owner PIN
- **Today line** under the buttons: today's sales, number of bills, medicines expiring in 30 days, medicines low in stock.
- A red banner appears if the last backup is more than 3 days old, with a button "Backup lo".

4.4 Dawai Becho (normal billing)

What you see: a big search box at the top (already ready to type), the search results below it, and the current bill on the right (on a phone, a bill panel that slides up). At the bottom: the **total in big numbers** and a green **Bill Banao** button.

How a sale goes:

1. Staff searches by medicine name, shelf QR code, company, short code (for example C1), shelf number (S-04), or scans a barcode.
2. The results appear as big rows: name, strength, how many in stock, price, and shelf ("S-04 par hai"). Tap or press Enter to add.

3. The medicine goes on the bill. The app picks the batch that expires first. The bill row shows name, strength, batch, expiry, quantity with big plus and minus buttons, and the amount.
4. Quantity can be strips or loose tablets (a button switches between them).
5. A discount can be given per item or on the whole bill, up to the limit set by the owner. More needs the Owner PIN.
6. If a medicine is a Schedule H or H1 drug, the app asks for patient name, doctor name and "Prescription dekhi?" before adding it.
7. If a medicine is out of stock, the app shows medicines with the same composition that are in stock, with their shelf, so the sale is not lost.
8. **Rukao (Hold)** keeps this bill aside so another customer can be served. **Wapas** removes the last item.
9. Press **Bill Banao** to go to payment (4.6).

Other buttons on this page: "Naya Bill" (clear and start again), "Purane Bill" (find an old bill to reprint or return), "Wapsi" (sales return).

4.5 Fast Bill (Rush Mode)

For busy times. It has **three ways** to add medicines fast, all on one screen.

A. Runner and cashier queue (main method)

1. The runner takes the doctor's prescription, collects the medicines from the shelves, and scans the barcode or QR of each one with the wireless scanner. Each scan adds that medicine to a **pending bill**. Scanning the same one again increases the quantity, and quantity can be added by computer person
2. After the last medicine the runner scans a special **NEXT BILL** barcode (a laminated card near the shelves). That pending bill is closed and a new one starts. There are also **UNDO** and **CANCEL** barcodes.
3. On the cashier's screen, the left side is the **Pending list**: Bill 1, Bill 2, Bill 3, each with number of medicines, how long it has waited, and a status (still scanning, ready). A bill waiting too long turns orange.
4. The cashier picks a ready bill (Up/Down keys and Enter). A **Confirm Card** opens (see below).
5. When a bill is finished, the next ready bill opens by itself.

The Confirm Card: one medicine at a time, large on the screen.

- Shows a photo of the pack (or a colour block with the name), the medicine name and strength, batch, expiry, price, shelf, and how many were scanned.
- A quantity box is already filled with the scanned number and ready to type. **Type a number and press Enter, and the next medicine appears.**
- Small key hints at the bottom: Enter = next, Left arrow = back, S = skip, L = loose tablets, Delete = remove, B = change batch.
- Shows "2 / 7" progress so the cashier knows how many are left.
- For a Schedule H drug it first asks patient and doctor details. For an out-of-stock item it shows same-salt substitutes to choose from.
- After the last medicine, the card shows the whole bill with the total. Enter goes to payment.
- Nothing is added without the cashier pressing a key, so a wrong scan is always caught.

If the scanner reads something the app does not know, a red message "Ye dawai nahi mili" appears and that scan is listed so it can be fixed.

B. Tile wall (optional)

Big coloured tiles of the 100 most sold medicines. Tap a tile to add one pack to the current bill. The owner can pin or remove tiles.

C. Short code

Type a short code like C1 or A3 and press Enter to add that medicine. Typing the first letters of a name and pressing Enter shows the result in a big confirmation (name, strength, batch, expiry) with an Undo button, so the wrong strength is never added by mistake.

4.6 Payment and finishing a bill

- Shows the full bill and the total in very large numbers.
- Four big buttons: **Cash**, **UPI**, **Udhaar**, **Aadha-Aadha (Split)**.
- **Cash:** staff types the amount given, the app shows the change to return.
- **UPI:** staff marks it paid after checking the phone.
- **Udhaar:** staff picks or adds a customer; the amount goes into that customer's credit.
- After payment: **Print** (A4 invoice or small receipt), **WhatsApp bhejo** (share the bill), or **Done**.
- The finished bill reduces stock automatically.

- Staff **cannot delete or edit** a finished bill. They can press "Owner ko poocho" and the owner enters the Owner PIN to allow it.

Sales return (Wapsi): find the old bill, pick the items coming back, the app puts them back in the same batch and shows refund as cash or reduction of udhaar.

4.7 Stock Jodo (adding stock from a supplier)

A step-by-step page with a progress bar at the top. One job per step; nothing is saved until the last step.

1. **Supplier:** pick a supplier from the list or add a new one. Type the invoice number and date.
2. **Invoice photo:** take a photo of the supplier's invoice. This is required. The app makes it small to save space.
3. **Medicines:** add one line at a time: medicine name, batch number, expiry (month and year), number of packs, free packs, purchase rate, MRP. The list grows as lines are added.
4. **Check and save:** shows all lines and the total. Press **Pakka Karo** to save. Stock goes up, and new batches are created.

The owner can open any past purchase and see the invoice photo and tick "Verified". A purchase return to the supplier can also be made from here.

4.8 Stock Dekho

- A search box and a big-row list of all medicines with the total in stock and the shelf.
- Tap a medicine to see every batch: batch number, expiry, quantity, and the shelf with a "Photo dekho" button.
- Filters at the top: **Kam stock** (low), **Khatam** (finished), **Sab** (all).
- **Kam stock list:** a ready shopping list grouped by supplier that can be shared on WhatsApp.
- Stock corrections (damaged, lost, count mistake) need the Owner PIN and are written in a log.

4.9 Expiry

- Four big tabs: **30 din** (red), **60 din** (orange), **90 din** (yellow), **Expire ho gaya** (black).
- Each row shows medicine, batch, expiry date, quantity, shelf.

- Each row has a button **Supplier ko wapas**. It starts a return record and tracks its status: pending, sent, credit received, rejected.
- The owner sees a line: "Pichle saal expiry se nuksan: Rs. X" and a month-by-month list of expiry losses.
- Expired batches can never be sold; the app blocks them in billing.

4.10 Udhaar and customers

- **Udhaar list:** all customers who owe money, biggest first, with how many days it is pending.
- Each row has **Paisa Mila** (record a payment) and a green **Yaad Dilao** button. Yaad Dilao opens WhatsApp with a ready message such as "Namaste, aapka Rs. 500 baki hai" when the amount is more than 7 days old.
- **Customer page:** name, phone, address, family members, doctor (optional), full history of bills and payments, a credit limit the owner can set.
- **Regular medicine reminder:** for customers who take medicines every month (BP, sugar), the app remembers how many days the medicine lasts and shows each morning "Kal dawai khatam, ready rakhein?" with a WhatsApp button.
- **Referral Sales Report:** shows how much was sold on prescriptions of each doctor. It only shows sales, no commission payments.

4.11 Medicine list (Owner area)

- Search and list of all medicines. Each has name, strength, form, salt, company, GST, HSN, MRP, units per pack, short code, barcode, shelf, Schedule type, minimum stock.
- **Naya Dawai** adds one. **File se Jodo** imports many from a spreadsheet file with a preview before saving. The app warns about duplicates.
- A short code (C1, A1) is made automatically and can be changed.
- Pack photo can be added once for each medicine; it appears in billing cards.

4.12 Sticker and barcode printing

- Choose medicines (all, selected, or only those without stickers).
- Choose the sheet type (24, 40, 65 or 100 stickers per A4 page) and see a preview.
- Each sticker has the **medicine name in big letters, a barcode, and the short code**.
- A test page helps line up the printer with the sticker sheet.

- Separate buttons print **shelf stickers** (QR with the shelf number) and the **control barcode card** (NEXT BILL, UNDO, CANCEL).
- Medicines from companies that already have barcodes on the pack can be linked once by scanning the pack, so no sticker is needed.

4.13 Suppliers

A list of suppliers with phone, GST number, and the amount still to be paid. Tap one to see all purchases from them, returns, and expiry returns.

4.14 Din Band (daily closing)

Four steps:

1. **Cash ginti:** staff types the cash counted.
2. **Milan:** the app shows expected cash and the difference. A mismatch is shown in red and needs the Owner PIN to close.
3. **Photo:** take one photo of the counter and cash.
4. **Report:** the app prepares a one-page report of the day (sales by cash, UPI and udhaar, bills made, expiry alerts, cash difference, photo). **WhatsApp par bhejo** sends it to the owner.

4.15 Owner area (Owner PIN needed)

A menu of big buttons:

- **Dashboard:** today's and this month's sales, cash versus UPI versus udhaar, profit, top selling medicines, expiry alerts, low stock, udhaar due, backup status, and staff activity.
- **Reports:** daily and monthly sales, GST summary, purchase register, stock value, expiry loss, supplier dues, udhaar due, Schedule H and H1 register, Referral Sales Report. Each can be printed or saved as a spreadsheet.
- **Staff:** add, pause or remove staff, reset PINs, see each person's bills, discounts, voids and PIN requests.
- **Audit log:** a list of every sensitive action (who, what, when) that nobody can edit.
- **Shelf map (Self):** every shelf has a number (S-01, S-02), a QR and a photo. When a medicine is searched, the app says "S-04 par hai" with a button to see the shelf photo. The owner moves a medicine to another shelf by drag and drop (or a picker on phone);

every move is saved: "S-04 se S-08, Owner, date". An optional morning check lets staff scan every shelf QR and shows the owner which shelves were missed.

- **Settings:** shop details, discount limit, auto-lock time, light or dark mode, label settings, Rush Mode settings, change PINs.
- **Backup and Restore:** save a backup file now, or restore from a backup file after confirming.

4.16 Alerts and reminders the app shows by itself

Alert	Where it appears
Medicines expiring in 90, 60, 30 days	Home line, Expiry page
Low stock	Home line, Stock page
Udhaar older than 7 days	Udhaar page, Home line
Regular customer's medicine finishing tomorrow	Udhaar page, Home line
Backup older than 3 days	Red banner on Home
Cash mismatch at closing	Din Band, Owner dashboard
Shelf check missed (if switched on)	Owner dashboard
Pending bill waiting too long	Fast Bill page

5. How the UI looks and feels

The screens are made for a 40 to 50 year old who is comfortable with WhatsApp and Facebook but not with business software. The design copies that comfort: simple, large, green, and chat-like.

5.1 Main ideas

- **One screen, one job.** Each page does one thing and shows one main action as the biggest button.
- **Everything within two taps** of Home. A Home button is on every page.
- **No hidden menus.** No tiny three-line menu or small icons without words. What you can do is always visible.

- **Words, icon and colour together.** Every button has a large icon, a Hindi word in English letters, and a small English word below it.
- **No fear of mistakes.** Every important action can be undone with **Wapas**. Dangerous actions ask clearly: "Pakka hatana hai?" with big **Haan** and **Nahi** buttons.
- **Speed on the counter.** On the computer the whole bill can be made with the scanner and keyboard. On a phone every action is a big touch button.

5.2 Size and shape

Part	Look
Text on buttons	20 to 24 px, bold
Normal text	18 px, nothing smaller than 16 px
Bill total	36 px or larger, always visible at the bottom
Buttons	At least 56 px tall, wide, with space between them so nobody taps the wrong one
List rows	60 px or taller with one line for the name and a smaller line for details
Number pad	Very large keys for PIN and quantity

5.3 Colours

Colours always mean the same thing so users learn them once.

- **Green:** go ahead (save, add, Bill Banao, sell)
- **Red:** stop or danger (delete, expired, mismatch)
- **Orange:** be careful (expiring soon, waiting too long)
- **Yellow:** early warning (90 days to expiry)
- **Blue:** information (help, details)
- **Grey:** not available now

Light mode (white background, dark text) for the day and **Dark mode** (dark background, light text) for the night. A switch is always at the top. Text is always high contrast so it can be read from a distance and in poor shop light.

5.4 Language

Labels are Hindi written in English letters with a small English word, for example **Dawai Becho** with "Sell" below it. Messages are short and plain: "PIN galat hai", "Ye dawai nahi mili", "Stock khatam". No technical words or error codes. A Hindi-script option can be added later.

5.5 Feedback

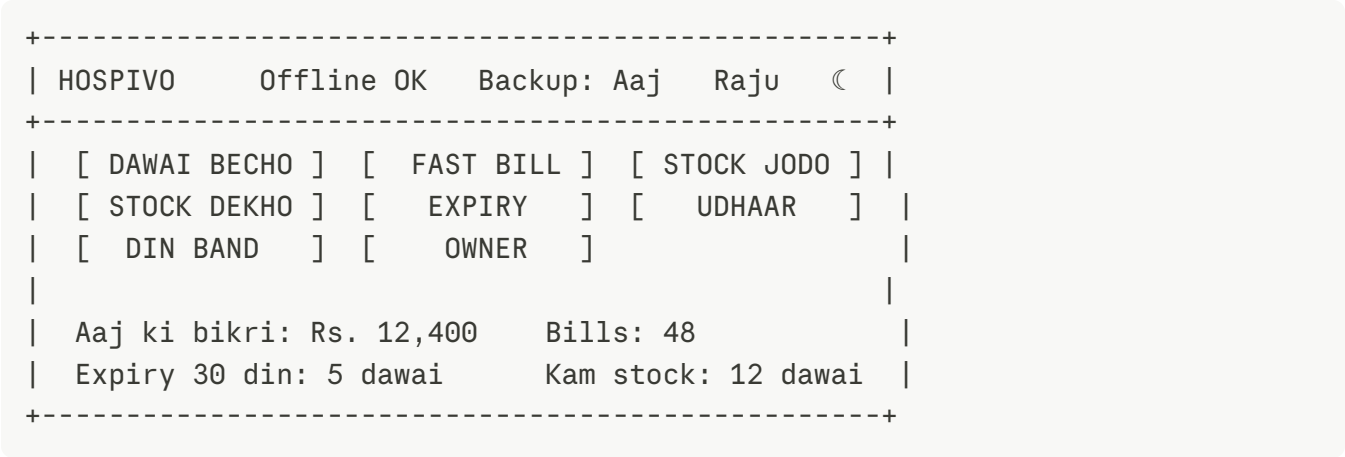

- A short **beep and green flash** when a medicine is added or a bill is saved.
- A different **buzz and red flash** with a clear message when something is wrong.
- New items on a bill briefly light up so the cashier sees what was just added.
- The bottom bar always shows "Offline OK" so the owner knows the app works without internet.

5.6 Lists, tables and cards

- Bills, stock and reports are **big-row lists and clear tables**, not many small cards, so more can be read at once.
- The **Home buttons** are big square buttons with an icon.
- The **Confirm Card** in Fast Bill is the one large card, used to confirm one medicine at a time.
- Empty pages show a friendly message and one big button, for example "Abhi koi dawai nahi. Pehli dawai jodo".

5.7 Sketches of the main screens

Home

Dawai Becho

```
+----------------------------+---------------------+

| Fark:          Rs. 140 kam   (RED)             |
| [ WAPAS ]                        [ AAGE ]      |
+------------------------------------------------+
```

6. Not in the first version

- Owner watching live from home on his own phone (for now the daily report goes through WhatsApp)
- Several computers sharing live data
- More than one runner scanning at the same time

- Payment of doctor commission
- Any artificial intelligence features

Hospivo: Minimal-Change Amendment

Online/cloud mode, offline operation, and owner approvals

How to use this document: The original 13-page *Hospivo: App and UI Description* is preserved unchanged at the beginning of this PDF. This amendment is appended after it. Only the specific sections identified below are updated or supplemented; all other original feature descriptions, workflows, wording, and UI sketches remain as originally written.

Important: Where this amendment says a section is replaced, read the amendment text together with the original document. If a detail conflicts, the amendment controls only for the named topic. It does not silently replace unrelated original requirements.

Change summary

- Adds two configurations: Local-only and Cloud-enabled.
- Keeps shop work local-first so permitted billing and stock tasks can continue without internet.
- Replaces the assumption that all owner approvals must use a PIN with an owner-configurable policy for each action.
- Adds remote owner approval requests through a secure owner web app in Cloud-enabled mode.
- Clarifies that an offline request has not reached the owner until connectivity returns.
- Adds only the synchronization, backup, and status details required to make the two modes understandable.
- Keeps the original billing, Fast Bill, stock, expiry, customer, supplier, label, and UI requirements otherwise intact.

Amendment A — Replace Section 1: What Hospivo is

Hospivo is software for an Indian medical store (dawai ki dukaan). It runs in the browser on the shop's computer or phone, like an app, and is designed to keep permitted shop work available without internet after initial setup. Hospivo supports two configurations:

Local-only configuration

- Shop data stays on the shop's device. Core permitted tasks such as billing, stock lookup, purchase entry, and expiry checks continue offline, subject to the app's local availability and device condition.
- There is no cloud synchronization, remote owner dashboard, remote monitoring, or remote approval. The owner uses the shop device and its local authorization rules.
- Backups are local/manual or scheduled where the device supports them. The owner must understand that a device-only backup can be lost if the device is lost or damaged.

Cloud-enabled configuration

- The shop app remains local-first: permitted work can continue offline, and changes wait in a local queue until internet access returns.
- When online, the app securely synchronizes configured shop data with the cloud and provides an owner web app for remote reports, approval requests, notifications, and registered-device status.
- Remote dashboards must show the last successful sync. They must not present stale data as live.

Both configurations retain the original Hospivo features: medicine billing, Fast Bill, batch-wise stock and expiry, supplier purchases, customer udhaar, barcode and shelf labels, daily closing, reports, and staff controls.

Amendment B — Replace the final paragraph of Section 2: Who uses it

Special actions (such as deleting or correcting a completed bill, changing a price, giving a discount above the limit, or correcting stock) follow the owner-configured authorization rule for that action. Depending on the rule and the selected configuration, authorization may use a local Owner PIN, remote approval from the owner's web app, or a block while offline. The original role permissions remain unchanged.

Amendment C — Add to Section 3: How a normal day goes

- At setup, the owner chooses Local-only or Cloud-enabled mode and configures offline approval rules for each supported action category.
- In Cloud-enabled mode, the shop app queues changes made offline and synchronizes them when internet returns. The app shows whether changes are pending, synced, or failed.
- Remote approval requests created while offline remain queued locally. The owner has not received the request until it successfully reaches the cloud.
- In Local-only mode, remote owner monitoring and remote approval are unavailable; the app must not imply otherwise.

Amendment D — Add to Section 4.1: First-time setup

Add a setup step to choose the operating configuration:

- Local-only: explain that data and backups remain on the shop device and that remote monitoring and remote approvals are unavailable.
- Cloud-enabled: sign in or register the owner account, connect the shop/device, explain which data is synchronized, and show the owner how to access the web app.

After setup, the owner configures offline approval rules by action category. The rest of the original setup flow remains unchanged.

Amendment E — Replace the relevant status details in Section 4.3: Home

Keep the original Home buttons, daily totals, alerts, and backup warning. Replace the generic 'Offline OK' status with a truthful status appropriate to the selected configuration:

- Local-only: show 'Local mode' and the last local backup status. Do not show cloud sync or remote approval as active.

- Cloud-enabled and connected: show connection status, last successful sync, pending/failed sync count, and backup status.
- Cloud-enabled but offline: show 'Offline — changes saved on this device' when locally saved, plus the number of pending changes/requests where applicable.

Show an Approvals button/count in Cloud-enabled mode when requests exist. Do not display that remote approvals are available in Local-only mode.

Amendment F — Add to Section 4.6: Payment and finishing a bill

Keep the original payment flow and staff restriction. Where staff needs authorization for a completed-bill edit, deletion, or another protected action, the staff member selects 'Owner ko poocho'. The app follows the configured rule:

- Remote approval required: create a request with the exact action, affected bill/record, requester, reason, shop/device, and time. In Cloud-enabled mode, send it to the owner's web approval inbox when connected.
- If offline, mark the request 'Waiting for internet — not sent to owner'. Do not execute the protected action until valid approval is received and verified.
- If the configured offline rule allows local Owner PIN authorization, request the PIN locally and record the decision in the audit history.
- If the rule blocks the action offline, explain that the action must wait. Other permitted work can continue.

An approval applies only to the specific request and action; it cannot be reused for a different bill or action.

Amendment G — Replace the authorization sentence in Section 4.14: Din Band

A cash mismatch is shown clearly and follows the owner-configured authorization rule. The staff member may record and save the cash count while authorization is pending, but the screen must clearly show that final closing is not complete. If remote approval is required and the shop is offline, the request remains queued and is not treated as approved. The original four-step daily closing and report remain otherwise unchanged.

Amendment H — Add to Section 4.15: Owner area

Owner area on the shop device

Keep the original local dashboard, reports, staff, audit log, shelf map, settings, and backup/restore features. Add an 'Offline approval rules' setting where the owner can select a policy for each supported action category.

Owner web app — Cloud-enabled configuration only

- Secure owner sign-in and shop selection.
- Approval inbox with request details, reason, affected record, requester, and shop/device.
- Approve/reject actions with a recorded decision, timestamp, and audit history. Require renewed owner authentication for high-risk actions where configured.
- Remote dashboard and reports based on synchronized data, with last-sync time and a clear stale-data indicator.
- Registered-device status and a way to revoke a lost or untrusted device.

The web app is not available for Local-only shops. Remote approval notifications are prompts to review a request; a notification alone is not authorization.

Amendment I — Add to Section 4.15: Backup and Restore

- Local-only: retain the original daily/local backup expectation, where supported, and show the last successful backup and any failure.
- Cloud-enabled: keep local backups and add encrypted cloud backup for the data selected for synchronization.
- Never label a backup successful until it has been verified. Keep the original restore confirmation step.
- Before release, test restoring backups and document retention, recovery, and data export/deletion behavior.

Amendment J — Replace the relevant wording in Section 5.5: Feedback

Keep the original beep/visual feedback for successful actions and clear error feedback. Replace the statement that the bottom bar always shows 'Offline OK' with this requirement: the interface must show the actual operating and connection state. Cloud-enabled mode must distinguish offline local operation, pending sync, successful sync, and sync failure. Local-only mode must be labelled as local mode and must not imply cloud connectivity.

Amendment K — Update Section 5.7: Home sketch

Keep the original Home layout and buttons. Change only the status area to reflect the selected configuration. Example Local-only status:

```
HOSPIVO   LOCAL MODE   Backup: Today   Raju
[ DAWAI BECHO ] [ FAST BILL ] [ STOCK JODO ]
[ STOCK DEKHO ] [ EXPIRY ] [ UDHAAR ]
[ DIN BAND ] [ OWNER ]
Aaj ki bikri: Rs. 12,400       Bills: 48
Expiry 30 din: 5 dawai         Kam stock: 12 dawai
```

Example Cloud-enabled status:

```
HOSPIVO   CLOUD-ENABLED   Synced: 10:42   Raju
[ DAWAI BECHO ] [ FAST BILL ] [ STOCK JODO ]
[ STOCK DEKHO ] [ EXPIRY ] [ UDHAAR ]
[ DIN BAND ] [ OWNER ] [ APPROVALS: 2 ]
Aaj ki bikri: Rs. 12,400       Bills: 48
Pending sync: 0                Backup: Today
```

If offline, replace the connected status with a clear message such as 'Offline — changes saved on this device' and show pending changes if any.

Amendment L — Replace Section 6: Not in the first version

The following are not promised unless separately implemented and tested:

- Owner viewing live data remotely is unavailable in Local-only mode. In Cloud-enabled mode, the owner sees synchronized data and its last-sync time; it may not be live when the shop is offline.
- Multiple computers/devices sharing cloud data are supported only in the Cloud-enabled configuration and require synchronization and conflict-handling tests. Do not silently overwrite stock movements or completed sales.
- More than one runner scanning at the same time remains outside the first version unless separately implemented and tested.
- Payment of doctor commission remains out of scope.
- Artificial intelligence features remain out of scope.
- Guaranteed instant push notifications across every browser/device are not promised.
- Remote approval cannot reach the owner while the shop has no internet. The request remains queued locally until connectivity returns.
- No claim is made that every high-risk action can be safely approved offline. Each action follows the owner's configured offline policy.

Amendment M — New acceptance checks for the added modes

- In Local-only mode, confirm that permitted local tasks work offline and that no remote dashboard/approval is shown as active.
- In Cloud-enabled mode, make changes offline, reconnect, and verify they synchronize without duplicate bills or stock movements.

- Create an online approval request and verify that the owner sees the correct action and record in the web app.
- Create an approval request while offline and verify the screen clearly says it has not reached the owner.
- Approve remotely while the shop is offline; after reconnection, verify the shop checks the approval before executing only the requested action.
- Try to reuse an approval or apply it to a different action and verify the app rejects it.
- Verify sync failures, backup failures, and stale remote data are clearly shown.

Scope safeguard: This amendment intentionally does not rewrite the original medicine, billing, Fast Bill, supplier, expiry, udhaar, barcode, shelf-map, report, and UI requirements except where a named section above needs a mode/approval clarification.
